

InstaGenerator Documentation

Prepared for Simphiwe · 2 October 2026

Live app: <https://claude.ai/artifact/HqDpHBFLKXkYBHrysF2owf>

1. Overview

InstaGenerator is a content generation app. You choose a type of content (a blog post, an email, code, or a social media post), fill in a few details, and the app builds a prompt from a template and generates a draft for you. A built-in prompt library holds the templates, and you can add your own.

The app was built as an individual project: a tool that generates content (blogs, emails, code) with a prompt library included.

2. Key Features

- **Four content types:** blog post, email, code, and social post.
- **Prompt library:** 11 ready-made templates, plus your own custom templates.
- **Fill-in forms:** each content type has its own fields, such as topic, audience, tone, length, language or platform.
- **Prompt preview:** see the exact prompt before it is sent.
- **Live generation:** the result streams in as it is written, with a Stop button.
- **Copy button:** copy the finished result in one click.
- **Light and dark mode:** switch themes from the button in the header.
- **Personal welcome:** the header greets you by name.

3. Getting Started

1. Open the app link above.
2. On your first generation, approve the permission request. Each generation runs on your own Claude account.
3. Choose a content type, fill in the form, and press **Generate**.

4. Using the Generator Tab

1. **Pick a content type** using the chips at the top: Blog post, Email, Code or Social post.
2. **Choose a prompt template** from the dropdown. Each template shapes the style of the result, for example a how-to guide versus an opinion piece.
3. **Fill in the fields.** The first field is required. The others have sensible defaults.
4. **Preview the prompt (optional).** Open "Preview the prompt" to see the filled-in prompt exactly as it will be sent.
5. **Press Generate.** The text appears in the Result card as it is written. Press **Stop** to cancel at any time.
6. **Press Copy** to copy the result to your clipboard.

Fields by content type

Content type	Fields
Blog post	Topic, Audience, Tone, Length
Email	Purpose, Recipient, Tone, Length
Code	Task or code, Language, Constraints (optional)
Social post	Topic, Platform, Tone

Available options

- **Tone:** Friendly, Professional, Witty, Authoritative, Warm.
- **Blog length:** about 300, 600 or 900 words.
- **Email length:** Short (under 100 words), Medium (150 words), Detailed (250 words).
- **Code languages:** Python, JavaScript, TypeScript, Java, C#, SQL, Go.
- **Social platforms:** LinkedIn, X / Twitter, Instagram, Facebook.

5. The Prompt Library

Open the **Prompt library** tab to browse every template. Use the chips to filter by content type. Each card shows the template text and three actions:

- **Use in generator:** switches to the Generator tab with that template selected.
- **Copy template:** copies the raw template text.

- **Delete:** appears only on your own custom templates.

Built-in templates

Type	Templates
Blog post	How-to guide, Listicle, Opinion piece
Email	Professional request, Follow-up, Apology or bad news
Code	Write a function, Debug and explain, Refactor with tests
Social post	Announcement post, Story post

How templates work

Templates are plain text with variables in double curly braces, such as `{{topic}}` or `{{tone}}`. When you generate, each variable is replaced with the value from the form. If a variable is left empty, it stays as a placeholder in square brackets, except an empty `{{constraints}}`, which becomes "none". The app then adds one closing instruction asking for only the finished content, with no preamble or commentary.

Example template:

```
Write a {{length}} how-to blog post about {{topic}} for {{audience}}. Tone: {{tone}}.
```

6. Adding Your Own Prompts

1. Open the **Prompt library** tab and scroll to **Add your own prompt**.
2. Enter a **title** and choose a **content type**.
3. Write the **template**, using the variables listed under the box. They change depending on the content type you choose.
4. Press **Add to library**.

Your template then appears in the library and in the Generator's template dropdown for that content type. Custom templates are marked "yours" and can be deleted at any time.

7. Appearance

- **Light and dark mode:** use the button at the top right of the header. It starts with your device's setting, then remembers your choice.
- **Colors:** buttons, selected tabs and chips, the logo, the app name and the welcome message use a turquoise theme. Light mode uses warm brown text.

8. Technical Notes

- The app is a single self-contained HTML page with its own styles and scripts. It needs no installation.
- Content is generated through the Claude sample capability that the hosting page provides. Each generation runs on the viewer's own Claude account.
- Custom templates and the theme choice are stored in the browser's local storage. They stay on that browser and device only and do not sync elsewhere.
- Nothing you type is stored by the app itself apart from those two settings.

9. Limitations

- Custom templates do not carry over to another browser or device.
- Generation needs permission to use Claude and may be unavailable when the page is viewed outside the Claude site.
- Results are drafts. Always review generated text and test generated code before using it.
- Heavy use may hit rate limits, in which case the app asks you to wait and try again.

10. Troubleshooting

Problem	What to do
"Please fill in..." message	Complete the first field of the form, then press Generate again.
"Permission is needed to generate content"	Approve the permission prompt, then try again.
"Too many requests"	Wait a moment and try again.

Problem	What to do
"Generation is not available in this view"	Open the app from its link on the Claude site.
Custom prompts missing	They are saved per browser, so check that you are on the same browser and device.
Copy button does nothing	Generate a result first. Copy only works when there is text in the Result card.

11. Ideas for Future Improvements

- Export results as a text or Word file.
- A history of past generations.
- Editing built-in templates.
- Syncing custom templates across devices.
